

VULNERABILITY ASSESSMENT

Service Overview

Many of the popular DCS, PLC and OT device providers have developed proprietary cybersecurity management services focused on their own platforms. While this is likely a great source for vendor specific assessments and monitoring, many components that integrate today's typical facility may well be left behind. The list may become overwhelming, incomplete, and difficult to manage.

Mangan Cybersecurity Services can help you to coordinate multiple vendor processes, programs and entities and make OT cybersecurity based recommendations on best case scenarios to meet your specific business needs and vulnerabilities identified. This is because our services combine client experience, platform knowledge and system integration expertise to ensure that one or many vendors' systems are looked at both individually as well as a complete system.

A complete facility OT cybersecurity vulnerability assessment within ICSSbD™ includes systems and processes that merge a wide range of DCS, PLC and OT device providers as well as interconnecting systems.

How We Can Help

- Coordination of multiple vendor vulnerability assessments and results.
- Inter-vendor assessments, recommendations and resulting risks associated as systems are integrated.
- Development of remediation strategies that combine multiple vulnerability assessments and its resulting infrastructure into a single business process to maintain a good cybersecurity posture.
- Direct alignment of multi-vendor assessments into Mangan's ICSSbD™ Business Alignment processes.
